DuPont™ Nomex China Electric Equipment (Jiangsu) Transformer Manufacture Co.,Ltd is authorized by DuPont to use this trademark, Normex © Is a trademark or registered trademark of DuPont Corporation and its affiliates.

Founded in 1990, CEEG has been focusing on manufacturing for 30 years and exporting guality power equipment to the world with the core values of "Vision, Innovation and Responsibility". So far, CEEG has three major industries: power transmission and distribution, new energy and system solutions, with industrial bases in Nanjing and Yangzhong. CEEG was successively awarded the honorary titles of National Innovative Enterprise, Top 500 Asian Brands, Most Influential Brand of China Electrical Industry, China Environmental Label, and National Contract-observing and Creditable Enterprise. In 2011, CEEG was ranked 183rd among the top 500 private enterprises in China with sales of 10.9 billion. China Electric Equipment (Jiangsu) Transformer Manufacture Co., Ltd. is a modern enterprise integrating manufacturing, sales and scientific research. It has a complete set of shearing machines, automatic wrapping machine, robotic automatic laminating machine, German Hedrich vacuum casting tank, vacuum impregnation, electric transfer vehicle and other advanced equipments representing a high level in the industry, and is the first in the industry to develop and apply transformer collaborative design platform to effectively combine product data, product development and production process. CEEG's products include VPI transformer, cast resin transformer, semi-envelope transformer, oil-immersed transformers, traction transformers, 220kV power transformers, 110kV power transformer, mining explosion-proof transformer, mining explosion-proof switches, high and low voltage switchgear, frequency conversion transformer, amorphous alloy transformer, anti-harmonic transformer, Scott transformer, substation, wind power transformer, marine transformer, etc. Its sales cover many industries such as electric power, electronics, hydropower, nuclear power, wind power, coal mines, communications, construction, petroleum, chemical industry, aviation, transportation, railroad, etc. Walking with giants and keeping pace with the world. CEEG has established long-term strategic partnerships with world-class companies such as DuPont, Schneider, ABB. Pursuing innovation, fulfilling responsibilities, and constantly surpassing products, quality, services and actions, it has developed into a domestic giant power transmission and distribution equipment supplier with a solid industrial foundation. Its cast resin dry type transformers have been exported to more than 40 countries and regions in the world. The strategic layout of brand internationalization and service globalization has been formed!

Make CEEG the world's first choice!

### **First-class product quality**

The first-class R & D team in the industry ensures that all performance indicators of products meet or exceed national standards, introduces scientific management mode and standardized operation of process flow in all links to ensure the excellent quality of each product.

The product structure can be flexibly designed according to the actual needs of customers, and all kinds of accessories can select corresponding models according to user requirements to meet the personalized needs of different customers.

中国电气为世界输出优质动力 CEEG Delivering Premium Power To The World

35kV

# Oil Type Power Transformer up to 35kV

# Low loss, low noise, stable and reliable

35kV series transformers have the following characteristics: no leakage, low loss, low noise, high reliability and cor-hanging free; and have passed the test of the National Transformer Quality Supervision and Inspection Center, and all indicators have reached the advanced level of domestic and international similar products. The performance indicators meet the energy efficiency requirements of the GB20052-2020 version.

# **Performance characteristics**

### 1. Low Loss

35kV

The core is made of high quality cold-rolled silicon steel sheet with high magnetic conductivity, using Swiss core automatic laminating machine for longitudinal and transverse shearing, multi-stage full-slant seam automatic laminating, core tying using overall pressure and PET tape tying process, effectively reducing the no-load loss and no-load current of the transformer. Transformer performance indicators are better than the national standard.

### 2. Low Noise

The noise of oil-immersed self-cooling transformer is mainly caused by the electromagnetic noise of the core, in order to reduce the noise, our company has taken the following measures:

- (1) Low magnetic flux density design
- (2) High quality silicon steel sheet with high permeability
- (3) Swiss automatic stacking machine to control the stacking accuracy
- (4) Reliable clamping and bracing measures
- (5) Special vibration damping measures.

### 3. No Leakage

The oil tank and oil storage cabinet have been tested for positive and negative pressure to ensure that there will be no oil leakage during normal operation. The components are installed with flange groove structure, and all seals are made of high quality once-formed acrylate rubber parts to prevent oil leakage.

### 4. Strong Short Circuit Resistance

In order to ensure that the transformer can withstand the impact of short-circuit current and will not cause any thermal and mechanical damage, for this reason, our company has taken the following measures in the design and manufacture:

(1) The transformer coils are calculated with reasonable ampere-turn balance and semi-rigid copper wire is used.

(2) The core clamping parts are calculated for strength and stiffness to meet the safety requirements of maximum short-circuit mechanical force.

(3) The winding pads are all densified and made of high-density rigid cardboard.

(4) The winding adopts integral set and integral pressing to ensure the accuracy of assembly and the short-circuit resistance.

The mature structure and technology of traditional transformer shall be adopted as far as possible in the structure of high-temperature liquid immersed transformer, which retains the advantages of reliability, good manufacturability and economy of the traditional transformer. The biggest difference between this transformer and the traditional transformer is that the actual situation of the temperature field in the transformer is reasonably considered in the design, and the insulation materials with different temperature resistance grades are reasonably used according to the temperature distribution to form a hybrid insulation system. With the help of transformer temperature field simulation technology, the temperature distribution of the transformer (mainly winding and its vicinity) can be determined more accurately. According to different temperature ranges, different grades of insulating materials can be selected to give full play to the high-temperature resistance characteristics of materials, and at the same time, it has a good economy. The actual maximum oil temperature of this liquid immersed transformer is set at 95  $^{\circ}$ C, which ensures that the transformer has good safety, thermal performance margin and long expected life. For the temperature design of the whole transformer, we propose and implement the concept of "seven-step temperature control technology" as the design principle, that is, gradually extend from the vicinity of the winding hot spot with the highest temperature to the external low-temperature area and divide it into five levels, and consider the short circuit and overload to form a seven-level thermal state for temperature control:

(1) Insulation material temperature control technology: different insulation materials shall be selected according to the temperature of different parts of the winding and body. The control winding hot spot temperature.

(2) Temperature control technology of liquid flow circuit: it is a technology to determine and control the liquid flow temperature of each part by comprehensively considering the relationship between liquid velocity field and temperature field. Control the boundary layer liquid temperature and top layer liquid temperature near the hot spot of the winding. (3) Overload temperature control technology: temperature rise control of various parts of the transformer under overload state. The temperature distribution under overload conditions is different from that underrated load operation. Attention should be paid to the temperature rise change under overload conditions in design.

(4) Iron core temperature control technology: temperature control of insulating parts in contact with iron core.

(5) Sealed temperature control technology: the thermal expansion, deformation, strength, etc. of the fully sealed oil tank, the influence and control with the change of temperature, so as to ensure the normal operation of the transformer within its allowable temperature range. (6) Component temperature control technology: components shall be made of insulation materials of the corresponding grade according to the temperature of their location, such as sealing gasket, etc. (7) Short circuit temperature control technology: in case of transformer fault short circuit, the value of short-circuit current flowing through the winding is very large, but the time is very short. It is usually calculated according to the adiabatic process. Under the condition of multiple short-circuit reclosing, the heat accumulation and heat dissipation effect shall be considered. Generally speaking, due to Nomex ® The paper has good high-temperature resistance, mechanical strength, and the change of dielectric coefficient and dielectric loss with temperature is very small. Even under the condition of multiple short-circuit reclosing, it will not cause mechanical damage and electrical failure due to temperature rise, and will not lose the service life of insulating materials.

# 35kV

# **Core Technology**

The active part adopts high temperature resistant hybrid insulation system, preferably matching parts, truly same 30 years design of the life-span.

Oil transformer all adopts the basic structure form of traditional transformer. The core is heart type; the high-voltage winding adopts pancake type coil; the low-voltage winding adopts wire-wound or foil type coil according to different capacities. The biggest difference with the traditional transformer is the choice of high temperature resistant insulating paper. The insulation structure of 35kV and below oil-immersed power transformer belongs to the mixed insulation system, the wire turn insulation uses high temperature resistant insulating paper, and the insulation material with lower temperature coefficient is used in the lower temperature parts.

Transformer structure and seven-stage temperature control schematic

### Excellent performance

35kV and below oil-immersed power transformers use high temperature resistant insulating paper as insulation material, and use different temperature resistant grade insulation materials for different temperature parts according to the temperature field principle, so it has good temperature resistance performance and large margin in the design.

High temperature resistant transformer can be safely operated in more than 40  $^{\circ}$ C ambient temperature, and does not affect its life-span. It is safe and reliable even when operating at 20% over rated capacity. It provides a good solution to the problem of safe power supply during peak load periods. The permissible load factor K24 values for 24-hour continuous operation at various ambient temperatures are tabulated against those of conventional distribution transformers as follows.

Ambient Temperature (℃)	-10	0	10	20	30	40
\$13(K24)	1.25	1.17	1.09	1.00	0.91	0.81
SRN(K24)	1.37	1.3	1.25	1.18	1.10	1.00

Performance comparison of transformers with high temperature resistant hybrid insulation system and oil-immersed transformers with conventional insulation materials.

ITEM	Conventional Insulation	Hybrid Insulation	Remark
Noise	Higher	Lower	The noise of hybrid insulated high temperature transformers is 5-8 c less than conventional insulated oil-immersed transformers
Life-span	Shorter	Longer	Hybrid insulated high temperature resistant transformers have a tru life expectancy of 30 years or more. Conventionally insulated oil-immersed transformers generally reach theoretical 30 years, with a typical life span of about 20 years.
Overload Capacity	Poorer	Stronger	At the same temperature: Hybrid insulated high temperature resistant transformers have a lor overload time and operate reliably. Conventionally insulated oil-immersed transformers have a short ov time, which accelerates the aging rate of the insulation.
Load factor at high temperature	Lower	Higher	At the same high temperature: hybrid insulation high temperature r transformers have a higher load factor than conventional ones.
Maintenance	Yes	Maintenance Free	Under normal circumstances, the hybrid insulation high temperatur transformer does not need to be serviced or replaced, maintenance
Losses	Lower	Lower	The combined losses of hybrid insulated high temperature resistant transformers are relatively low comparing to those of conventional
Voltage	Higher	Higher	
Capacity	Larger	Larger	Since the structure of hybrid insulated high temperature resistant tra
Service Location	Indoor/Outdoor	Indoor/Outdoor	voltage and larger capacity products can be manufactured just like
Moisture Resistance	Good	Good	use and have better resistance to moisture and dust.
Dust Resistance	Good	Good	

### High temperature resistant hybrid insulation system

# **Technical Advantages**

### R & D Team

CEEG has established a strong technology R & D team, with technology R & D platforms such as postdoctoral workstation, Jiangsu power transformation equipment engineering technology research center, Jiangsu graduate workstation and Jiangsu technology center, in conjunction with the Institute of electrical engineering, Chinese Academy of Sciences, Southeast University, Nanjing University of Aeronautics and Astronautics, Jiangsu University China University of mining and technology and other well-known scientific research institutions and universities jointly carry out a series of technological R & D and innovation.

### R & D Cloud Platform

It integrates the functions of electromagnetic optimization design, parametric drawing, performance analysis, structural optimization and automatic drawing of transformer, so as to realize the sharing of transformer design resources, search, modification and version control of various data information.

### Intelligent Operation and Maintenance Platform

Online power quality analysis and fault alarm can be realized by collecting key data such as transformer temperature, current, voltage, vibration and grid harmonic, and can be installed on mobile phone.

### Key equipments and process layout

### **Testing Station**

Invest 50 million to build the industry's superb high-voltage testing station.

### Medium and high voltage transformer production workshop

35kV
